

I CLAIM:

1. A rotatable lighting decoration including a supporting frame with two
5 downward connecting slices, two conductive pins being mounted
respectively on the two connecting slices, wherein one of the
conductive pins connects with an electrical wire connected to positive
pole of power source and the other connects with another electrical
wire connected to negative pole of power source; a joint having an
10 inner bearing being provided under the frame for holding a conductive
rod of a motor, which has a conductive ring around the body of the
motor, and the said two conductive pins contacting with the
conductive rod and the conductive ring respectively for electrical
connection therebetween, and a patterned decoration being connected
15 with a link mounted under the motor, a light string being hung on the
decoration, wherein two ends of the electrical wire of the string are
connected with the conductive rod and the conductive ring
respectively.
